ADVANTAGE FORTRESS

Control Options

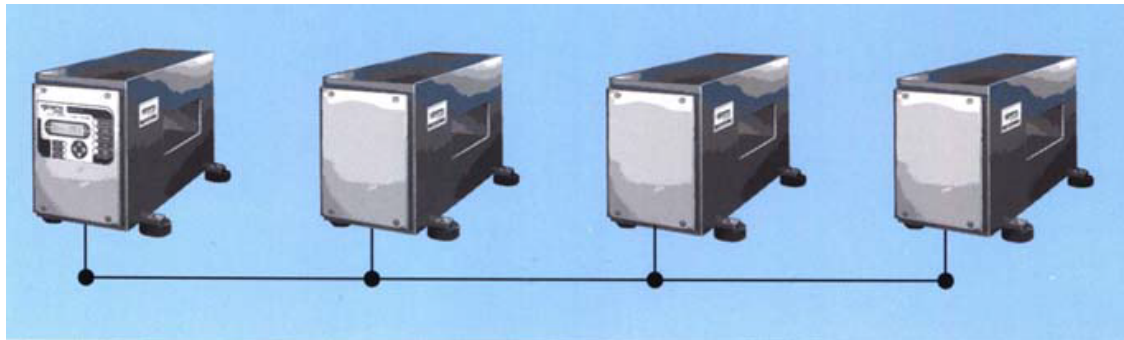

The display terminal for the Phantom model is designed as a smart terminal with its own microprocessor. The display terminal is not required for full operation of the detector, only for set-up changes. This allows for the following options that would be impossible with other equipment:

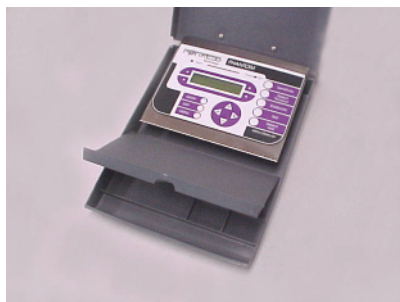

- Remote control from up to 1200 m (4000 ft) away.
- Portable/Removable option - display can be removed from the detector and plugged in only when required to change set-up parameters, providing the ultimate in security
- Multiple detectors can be controlled from a single point when multiple detectors are in a location that is difficult to access
- Multiple controls - a single detector can be monitored from more than one location or two controls may be used for one detector
- Network Control; the display interface can be replaced by any PC running Fortress 'Contact' software.

Run multiple search heads from a single control interface

With Phantom models, multiple detectors can be controlled by a single control interface. This option can reduce both equipment and installation costs, especially in applications where groups of detectors are installed in difficult to access locations.

Portability

The clipboard style control panel is portable enough to be carried by an operator. It provides all the functionality of the regular control panel plus a solid surface for taking notes and a small storage compartment.
